MIT's Technology Review Features Advanced Steam Engine from Cyclone Power Technologies

POMPANO BEACH, FL, Dec. 22, 2009. Massachusetts Institute of Technology's online publication Technology Review.com has featured a story on Cyclone Power Technologies Inc. (Pink Sheets: CYPW) and its heat-regenerative, external combustion engine.

The posting by Technology Review's energy editor, entitled Return of the Steam Engine?, discusses the renewed development in advanced steam technology, and how these all-fuel, clean burning engines - specifically Cyclone's - could one day replace the internal combustion engine.

Cyclone's patented external combustion engine is heat-regenerative, capturing lost energy and feeding it back into the engine (a process known as a Schoell Cycle). It is also water lubricated, allowing it to run on higher operating temperatures. The result of these processes is thermal efficiencies well over 30%, all in a compact package capable of being placed into automotive or stationary power generation applications. Equally important, the Cyclone is able to run on virtually any fuel, including liquid biofuels and solid biomass, and combusts these fuels at atmospheric pressures which avoids the creation of NOX emissions.

"We welcome discussion of steam engines alongside today's top performing internal combustion engines, as well as batteries and fuel cell technologies of the distant future," stated Harry Schoell, CEO of Cyclone. "We have made substantial progress in just a few years on our external combustion engine, and it is time that serious players in the automotive and power generation industries revisit this clean, capable and proven technology."

MIT's Technology Review is the oldest technology magazine in the world, established in 1899, and states on its website that it aims to promote the understanding of emerging technologies and analyze their commercial, social and political impacts.

Corporate Profile

Cyclone Power Technologies is the developer of the award-winning Cyclone Engine - an eco-friendly external combustion engine with the power and versatility to run everything from portable electric generators and garden equipment to cars, trucks and locomotives. Invented by company founder and CEO Harry Schoell, the patented Cyclone Engine is a modern day steam engine, ingeniously designed to achieve high thermal efficiencies through a compact heat-regenerative process, and to run on virtually any fuel - including bio-diesels, syngas or solar - while emitting fewer greenhouse gases and irritating pollutants into the air. Currently in its late stages of development, the Cyclone Engine was recognized by Popular Science Magazine as the Invention of the Year for 2008, and was presented with the Society of Automotive Engineers' AEI Tech Award in 2006 and 2008. Additionally, Cyclone was recently named Environmental Business of the Year by the Broward County Environmental Protection Department. For more information, visit www.cyclonepower.com.
